Maintenance in the nutrition required for an animal to maintain its optimal weight. Energy and the ability of the body to perform functions.

UAN'S APPROACH TO FORMULATION

Feeding has a direct impact on the growth rate, production capacity and health status of the animal. Feeding is key for a profitable and sustainable farming.

Animal dietary needs consist of nutrients, which are the components present in the feed that animals can digest and utilize. Hence, when feeding a diet, it is important to make sure of the nutrient content. UAN's nutritional formulation is complete for all feeding needs.

UAN supports sustainable practices that meet the needs of the present without compromising the ability of future generations to meet their needs. Applying these concepts to food and feed production, nutritional sustainability is the ability of a food system to provide sufficient energy and essential nutrients required to maintain good health in a population without compromising the ability of future generations to meet their nutritional needs. Ecological, social, and economic aspects must be balanced to support the sustainability of the overall food system.
